## **Home energy storage device charging and discharging data**

## Overview

---

This dashboard provides a graphical representation of 5-minute average values for total discharging, total charging, and net output from Energy Storage Resources (ESRs) computed using real-time telemetered data. What are the different types of energy storage applications?

Energy storage applications can typically be divided into short- and long-duration. In short-duration (or power) applications, large amounts of power are often charged or discharged from an energy storage system on a very fast time scale to support the real-time control of the grid.

What is energy storage?

Energy storage refers to any type of physical or chemical system that stores electrical energy for later use. For example, batteries use chemical energy, which can then be used to power your smartphone, laptop, or electric vehicle.

How do energy management systems work?

Coordination of multiple grid energy storage systems that vary in size and technology while interfacing with markets, utilities, and customers (see Figure 1) Therefore, energy management systems (EMSs) are often used to monitor and optimally control each energy storage system, as well as to interoperate multiple energy storage systems.

What type of energy is stored in different domains?

Energy stored in many different domains Input and output energy is electrical Three-phase AC power Conversion is required between the storage domain and the electrical domain Transformer Power conversion system (PCS) K. Webb ESE 471 27 System Configurations – Mechanical Mechanical storage Pumped hydro, flywheels, compressed air.

What are the merits of energy storage systems?

Two primary figures of merit for energy storage systems: Specific energy

Specific power Often a tradeoff between the two Different storage technologies best suited to different applications depending on power/energy requirements Storage technologies can be compared graphically on a Ragone plot Specific energy vs. specific power.

What is a fully discharged power supply (SoC)?

The amount of energy stored in a device as a percentage of its total energy capacity Fully discharged: SoC = 0% Fully charged: SoC = 100% Depth of discharge (DoD) The amount of energy that has been removed from a device as a percentage of the total energy capacity K. Webb ESE 471 6 Capacity
