## **Inverter power is getting smaller and smaller**

## Overview

What happens if a solar inverter is too small?

1. Energy Conversion Efficiency Undersized Inverter: If the inverter is too small, it cannot handle the full output of the solar panels, leading to energy losses due to “clipping” during peak production times. This limits the maximum power output to the inverter’s capacity, potentially wasting energy on sunny days.

What if my inverter is bigger than my solar array?

An inverter that is the same size (in kW) or larger than your solar array is being under-utilised. An inverter that is paired with a solar array of up to 33% higher power will be operating at maximum power for longer each day. 2. Regulatory requirements But why a 6.6kW array of solar panels with a 5kW inverter?

.

How does inverter size affect performance?

Here are several key ways that inverter size impacts performance: 1. Energy Conversion Efficiency Undersized Inverter: If the inverter is too small, it cannot handle the full output of the solar panels, leading to energy losses due to “clipping” during peak production times.

What is undersizing a solar inverter?

When you pair an inverter that is underrated for the amount of power the system is designed to generate, that’s called undersizing. There is also a situation where it may make sense to pair an inverter that’s rated higher than the solar array’s output. That’s known as oversizing.

What happens if you undersize an inverter?

When you undersize an inverter, you pair it with a system that can produce

more power than the inverter is rated for. That can cause inverter clipping. Clipping happens when there is more DC power being fed into the inverter than it is rated for. When that happens, the inverter will produce its maximum output and no more.

Can a solar panel be more than 33% larger than an inverter?

Clean Energy Council regulations dictate that solar panel arrays cannot be more than 33% larger than the inverter they are paired with, otherwise the STC rebate will not be applicable. (The amount of the STC rebate is based upon the DC power output from the array of panels. So in this example, the STC is based on the 6.6kW of panels.)
