## **Why does the base station power supply need 48V**

## Overview

---

The short story is that -48 V DC, also known as a positive-ground system, was selected because it provides enough power to support a telecom signal but is safer for the human body while doing telecom activities. What is a -48V power supply system?

Products basically use -48V power supply system, and the actual measured voltage is generally -53.5V. This is because for reliability reasons, communication equipment is equipped with a backup battery (-48V). In order to ensure reliable charging of the battery, the supply voltage needs to be slightly higher than the battery voltage.

Can a 48 volt DC power supply save a data center?

(Fig. 5) As shown in this example, when the power per rack exceeds 10 kW, the power distribution loss generated by traditional 12-V DC power is said to reach an intolerable level, but a 48-V DC power supply significantly contributes to power saving for a data center.

Why is 48 a good system voltage?

Back in the day, when Telephony equipment was being developed, 48 was the chosen system voltage because it's considered safe "low voltage", and reduced amperage requirement of equipment powered at this voltage.

Why is a -48 V DC a positive ground system?

The short story is that -48 V DC, also known as a positive-ground system, was selected because it provides enough power to support a telecom signal but is safer for the human body while doing telecom activities.

What is the operating voltage range for -48V system equipment?

For -48V system equipment, the required operating voltage range is -38.4V ~ 57.6V, but in fact we generally require the operating range -36V ~ -72V. The main consideration is that -48V system equipment must be compatible with

-60V power supply system, which requires -48~-72V.

What is a 48 volt DC power source?

This technique has gained widespread support toward optimization of components and circuits and achieving industry-wide adoption in the data-center-related businesses. 48-V DC power is applied to the AC/DC power source to the DC/DC power input terminal of each computation board.

## Why does the base station power supply need 48V
